N documents. For a word A in the collection, we use p(X_A), where X_A \in \( \frac{1}{0}, 1 \), to represent the probability that A occurs (X_A=1) in one document or not (X_A=0). If word A appears in N_A documents, then p(X_A=1) = N_A / N and p(X_A=0) = (N-N_A) / N. Similarly, we can define the probability p(X_B) for another word B. We also define the joint probability of word A and B as follows:  p(X_A = 1, X_B = 1): the probability of word A and word B co-occurring in one document. If there are N_{AB} documents containing both word A and B in the collection, then p(X_A=1, X_B=1) = N_{AB} / N  p(X_A = 1, X_B = 0): the probability that word A occurs in one document but B does not occur in that document. It can be calculated as p(X_A=1, X_B=0) = (N_A - N_{AB}) / N  Write down the formulas for p(X_A=0, X_B=1) and p(X_A=0, X_B=0). Select the two formulas from the following options (select all that applies):  \[ (N_A - N_{AB}) / N  \]  (N_B - N_{AB}) / N	QUESTION 8	5 points Saved

Next, we will use the following tables to do some real computation of Mutual Information. The tables contain the document counts for different words. There are a total of N = 26,394 documents in the collection. Table 1 contains the document counts for words 'computer' and 'program', derived from the document collection (Hint: If A = computer and B = program, then  $N_{AB} = 349$ . This means there are 349 documents that contain 'computer' AND 'program'):

p_{computer	} = 1   p_{computer} = 0
p_{program} = 1 349	2021
p_{program} = 0 1041	22983

(Table 1: "computer" and "program")

Table 2 contains the document counts for words 'computer' and 'baseball', derived from the same document collection:

p_{compute	er} = 1 p_{computer} = 0
p_{baseball} = 1 23	2121
p_{baseball} = 0 1367	22883

(Table 2: "computer" and "baseball")

Use the document counts from Table 1 and 2 to compute the value of  $x = I(X_{computer}; X_{program})$ . Fill in the following blank with the value of x:

(Requirement for filling the blanks: you must round the result to 4 decimal places for exact match of the answer, i.e., you won't get any credit for rounding to 2 decimals or 3 decimals places even your answer is correct

For example, 0.3333333 => 0.3333; 0.6666666 => 0.6667)

(Assume the base of log is 2.)

[x]

0.0092

**QUESTION 10** 

[Continued from the previous question]

Use the document counts from Table 1 and 2 from the previous question to compute y = I(X\_{computer}; X \_{baseball}). Fill in the following blank with the value of y:

(Requirement for filling the blanks: you must round the result to 4 decimal places for exact match of the answer, i.e., you won't get any credit for rounding to other number of decimals places even your answer is correct.

For example,  $0.33333333 \Rightarrow 0.3333$  (correct), 0.33 (wrong);  $0.66666666 \Rightarrow 0.6667$  (correct), 0.6666667 (wrong))

(Assume the base of log is 2.)

[y]

0.0032

QUESTION 11

## (Continued from the previous question)

Using Table 1 and Table 2 from the previous question, compute the values of  $z = I(X_{program}; X_{computer})$  and  $w = I(X_{baseball}; X_{computer})$ . Fill in the following two blanks with the values of z:

(Requirement for filling the blanks: you must round the result to 4 decimal places for exact match of the answer, i.e., you won't get any credit for rounding to other number of decimals places even your answer is correct.

For example, 0.3333333 => 0.3333 (correct), 0.33 (wrong); 0.6666666 => 0.6667 (correct), 0.666667 (wrong))

(Assume the base of log is 2.)

z: 0.0092

Do the comparative results from the previous question conform with your intuition? Explain your intuition.	
For the toolbar, press ALT+F10 (PC) or ALT+FN+F10 (Mac).	
Paragraph \$ Arial \$ 3 (12pt) \$	
It conforms with my intuition that 'program' and 'computer' gives more mutual information. 'Program' and 'computer' have more correlation than 'baseball' and 'computer' since there are more documents that contain both 'computer' and 'program' and neither 'computer' nor 'program' (349+22983 = 23332 > 23+22883 = 22906).

p(i): no, if there exists i such that p(i) = 0, the output  $D_{KL}(p||q)$  is not valid; q(i): no, if there exists i such that q(i) = 0, the output  $D_{KL}(p||q)$  is not valid;

QUESTION 18 5 points

Suppose there are two distributions p and q, and the two distributions are in Table 3 as below.

i p q 0 0.5 0.5 1 0.5 0 2 0 0.5

## Table 3

Here some values of p and q are 0. We can resolve the 0 probabilities issue using the smoothing technique in information retrieval.

To smooth p and q, one way is to replace p(i) in Table 3 with a smoothing function, (1-lambda) p(i) + lambda  $^*$  1/N, where N is the number of unique values of p, i.e., N = 3 in Table 3. Similarly, we can replace q(i) in Table 3 with (1-lambda) q(i) + lambda  $^*$  1/N. After smoothing **for both p and q**, What is the new value of x = D\_{KL} (p||q) when lambda = 0.1? Fill in the blank below with the value of x:

(Requirement for filling the blanks: you must round the result to 4 decimal places for exact match of the answer, i.e., you won't get any credit for rounding to 2 decimals or 3 decimals places even your answer is correct.

For example,  $0.33333333 \Rightarrow 0.3333$ ;  $0.66666666 \Rightarrow 0.6667$ ) [x]
